) VIRTUAL MALL SYSTEM

)Abstract:

Date of filing:

DBLEM TO BE SOLVED: To reduce the burden load on the user side by culating a charge including a delivery change by using either one of 1st l 2nd delivery tables while referring to a delivery area table and a nmodity master at the time of receiving a charge calculation request for ommodity to be purchased.

LUTION: When a charge calculation request for a commodity to be chased is outputted from a client 2 to a WWW server 3 through an erconnection network (Internet) 1, either one of the 1st delivery table ι for defining the delivery charge of a commodity to be used based on intity and the 2nd delivery table 30b for defining the delivery charge of commodity based on an amount is selected by referring to a delivery a table 20 and a commodity master 40 stored in the server 3. A charge luding a delivery charge is calculated in the delivery form of each store I in each delivery area by using the selected table. Consequently the antity of information for specifying a delivery address by a user can be luced and the burden on the user side can be reduced.

IMS

 $\lim(s)$

im 1] A server and a client are connected to an information network and said server realizes the virtual Mall which sists of two or more virtual online shop by the HTML file. Said client chooses the goods for purchase to this server he screen which required and acquired the HTML file of desired virtual online shop through said information vork. In the virtual Mall system which purchases said goods after making fee calculation perform to said server by lishing a fee calculation demand and checking the count result said server The delivery area table defined for said ry virtual online shop when the delivery charge of said goods changes with delivery areas, The 1st delivery charge e which defines the delivery charge of goods by the quantity base, and the 2nd delivery charge table which defines delivery charge of goods by the amount-of-money base, The goods master to which the information which directs ther to use the delivery charge table of either the 1st or a 2nd about the price information on goods and these goods nade to correspond, The virtual Mall system characterized by providing an operation means to perform tariff sulation which was referring to said delivery area table and the goods master, and includes a delivery charge using [a gap or] delivery charge table if there is a fee calculation demand to the goods for purchase from said client. aim 2] It is the virtual Mall system characterized by setting up the flag information which directs whether said 1st very charge table makes a fixed amount the delivery charge to the amount of predetermined numbers about said ds in a virtual Mall system according to claim 1, or a delivery charge is specified per goods. aim 3] It is the virtual Mall system characterized by setting up the policy information which specifies whether the

1 total of each delivery charge to each destination is taken as a delivery charge, or the predetermined tariff set up orehand is taken when two or more addresses for delivery exist in the delivery area where said delivery area table

ivers said goods in a virtual Mall system according to claim 1.

aim 4] If the fee calculation demand which is connected to an information network, realizes the virtual Mall which isists of two or more virtual online shop by the HTML file, and contains a part of name, zip code, and address from I information network is received The WWW server which publishes the retrieval demand which contains a part of ne, zip code, and address in said information network, and answers demand issue origin in the acquired name, a zip le, and the address, The goods for purchase are chosen on the screen which required and acquired the HTML file of ired virtual online shop through said information network to said WWW server. As destination information on said ods The client which determines the purchase of said goods after directing a part of name, zip code, and address, king fee calculation perform by publishing a fee calculation demand to said WWW server and checking the count ult, Connect with said information network and it has the address master into which the information which contains a ne, a zip code, and the address at least was registered. The virtual Mall system characterized by providing the address rieval server which searches said address master to the retrieval demand containing a part of name from said WWW ver, zip code, and address, and answers a letter in a retrieval result.

aim 5] A server and a client are connected to an information network and said server realizes the virtual Mall which isists of two or more virtual online shop by the HTML file. Said client publishes the offer demand of the HTML file desired virtual online shop through said information network to said server. The browser screen which uses as the irce the HTML file offered from said server is displayed. In the virtual Mall system which purchases said goods after posing the goods for purchase on this browser screen, making fee calculation perform by publishing a fee calculation mand to said server and checking that count result Said client possesses a means to put in and publish Customer ID to okie contained in this in the offer demand of said HTML file. Said server The customer master which Customer ID is ide to correspond and registers the customer information on said client which publishes the offer demand of said ML file which contains a name, the address, a zip code, and the telephone number at least, When the offer demand of d HTML file is received from said client, The virtual Mall system which searches said customer master based on the stomer ID contained in said Cookie, and is characterized by providing a means to insert the acquired customer

TAILED DESCRIPTION

etailed Description of the Invention]

011

eld of the Invention] This invention relates to the virtual Mall system managed on information networks, such as the ernet.

021

escription of the Prior Art] Although use of the virtual shopping mall on the Internet (virtual Mall) has increased with spread of the Internet, when a user performs shopping in a virtual Mall, there are many inconvenient points npared with actual shopping, and an improvement is desired.

03] A delivery charge is calculated as one-piece opening which the thing of the same conveyance place puts in rality at one box of timber for wooden box, and is delivered according to the delivery gestalt, for example, a small cle, best possible when a visitor tries to purchase two or more goods by the actual dealer, for example, a department re, mail order, etc. and I try to have them delivered, after each magnitude, weight, etc. of goods are investigated by official in charge.

104] On the other hand, the goods of various magnitude and weight are treated in the virtual Mall on the Internet as ll as a dealer actual on each mall (store).

105] However, in the virtual Mall, since there is no correspondence of an official in charge, count of a delivery charge

been simplified in many cases.

106] carrying a mailing cost with per [average in making for example, goods price into the price of a delivery charge np | goods **** -- or the whole country -- uniform -- how much -- as -- there are also many malls which take the stalt which unifies a delivery charge.

107] Moreover, in order for a user to purchase goods, the input of the quotient lot number number corresponding to a de name or a trade name etc. is the need, and also it is necessary to input the destination for sending goods to a user. 108] However, the information of this destination is information which consists of a name, a zip code, the address, the ephone number, etc., and is too large by keying such destination information in recent years for the user familiar to selection input by pointing devices, such as the computer operation under a graphic user interface (GUI) vironment, i.e., a mouse etc. [of a user's burden]

)09] Moreover, HyperText Transfer Protocol (HTTP is called hereafter) which is a standard protocol in the virtual all system of the Internet is the easy protocol of connecting by the connection request from a client, and exchanging d cutting a request and a response, as shown in drawing 10. Since it is carried out in this protocol whenever nnection of a circuit is a request, if it connects with a server from the connection through a proxy server, or the serial nnection using dynamic addressing, a server recognizes it as a different client in spite of the same client, and since a ferent IP address is returned, by the client side, it will become a different IP address in spite of the same client.)10] That is, even if it performs goods order two or more times to the same mall by the client side, it is not specified the same client as last time each time, but whenever it accesses a mall and purchases goods, it is necessary to input a er's own information (a name, a zip code, address, telephone number, etc.).

2111 roblem(s) to be Solved by the Invention] Thus, there is a problem that how to pay the delivery charge to the goods nich the user purchased by the conventional virtual Mall system mentioned above unlike shopping in an actual partment store, an actual mail order, etc. is rough, and a user wishes. Moreover, it had to key in order to direct the stination of the goods which the user purchased, and this input is troublesome and there was a problem that the burden the side of a user was large. Furthermore, although information is exchanged by HTTP which is the standard protocol the Internet between the server by the side of the virtual Mall connected to the network, and the client by the side of a

- this protocol is not used effectively but a user purchases goods, it is necessary to input a user's own rimation (a name, a zip code, address, telephone number, etc.), and has become the factor to which this also enlarges burden by the side of a user.
- 12] It was made in order that this invention might solve such a technical problem, and the 1st purpose is in offering ppings, such as an actual department store and a mail order, and the virtual Mall system which can perform delivery rge count fine almost similarly.
- 13] Moreover, the 2nd purpose of this invention is to mitigate the burden at the time of a user inputting the tination information which is the destination of purchase goods.
- 14] Furthermore, the 3rd purpose of this invention is managing the information of the user who purchased goods e on the mall, using HTTP effectively, and it is in mitigating the burden by the side of a user by lessening the input Jser Information as much as possible after it.
- eans for Solving the Problem] In order to attain the above-mentioned purpose, a virtual Mall system according to m 1 A server and a client are connected to an information network and said server realizes the virtual Mall which sists of two or more virtual online shop by the HTML file. Said client chooses the goods for purchase to this server the screen which required and acquired the HTML file of desired virtual online shop through said information work. In the virtual Mall system which purchases said goods after making fee calculation perform to said server by olishing a fee calculation demand and checking the count result said server The delivery area table defined for said ry virtual online shop when the delivery charge of said goods changes with delivery areas, The 1st delivery charge le which defines the delivery charge of goods by the quantity base, and the 2nd delivery charge table which defines delivery charge of goods by the amount-of-money base, The goods master to which the information which directs ether to use the delivery charge table of either the 1st or a 2nd about the price information on goods and these goods nade to correspond, If there is a fee calculation demand to the goods for purchase from said client, it is characterized providing the description for providing an operation means to perform tariff calculation which was referring to said ivery area table and the goods master, and includes a delivery charge using one [a gap or] delivery charge table. 16] It has the 2nd delivery charge table which defines by invention according to claim 1 the delivery charge of the delivery charge table and goods which defines the delivery charge of goods by the quantity base with the amount-ofney base. By having been made to compute the fine delivery charge for each store of every and every goods using se tables, it can respond to the calculation gestalt of various delivery charges according to each store of a virtual ill, and the almost same fine delivery charge count as actual shopping can be performed.
- 117] The virtual Mall system according to claim 2 is characterized by setting up the flag information which directs ether said 1st delivery charge table makes a fixed amount the delivery charge to the amount of predetermined nbers about said goods, or a delivery charge is specified per goods in the virtual Mall system according to claim 1. 118] In invention according to claim 2, whether the delivery charge to the amount of predetermined numbers is made o a fixed amount about goods or a delivery charge's being specified per goods, and fine assignment can be performed referring to the 1st delivery charge table.
- 119] The virtual Mall system according to claim 3 is characterized by setting up the policy information which ecifies whether the sum total of each delivery charge to each destination is taken as a delivery charge, or the eletermined tariff set up beforehand is taken, when two or more addresses for delivery exist in the delivery area area table delivers said goods in the virtual Mall system according to claim 1.
-)20] In invention according to claim 3, when two or more addresses for delivery exist in the delivery area which livers goods by referring to a delivery area table, whether the sum total of each delivery charge to each destination is ten as a delivery charge or the predetermined tariff set up beforehand being taken, and fine assignment can be reformed.
- D21] A virtual Mall system according to claim 4 If the fee calculation demand which is connected to an information twork, realizes the virtual Mall which consists of two or more virtual online shop by the HTML file, and contains a rt of name, zip code, and address from said information network is received The WWW server which publishes the rieval demand which contains a part of name, zip code, and address in said information network, and answers demand the origin in the acquired name, a zip code, and the address, The goods for purchase are chosen on the screen which quired and acquired the HTML file of desired virtual online shop through said information network to said WWW rver. As destination information on said goods The client which determines the purchase of said goods after directing part of name, zip code, and address, making fee calculation perform by publishing a fee calculation demand to said WW server and checking the count result, Connect with said information network and it has the address master into nich the information which contains a name, a zip code, and the address at least was registered. Said address master is

ched to the retrieval demand containing a part of name from said WWW server, zip code, and address, and it is acterized by providing the address retrieval server which answers a letter in a retrieval result.

- 22] By invention according to claim 4, the input of destination information which a user performs in a virtual Mall em for goods purchase can be made into a part of name, zip code, and address, and the amount of the information cified by a user can be lessened by publishing the retrieval demand containing this.
- 23] That is, the burden at the time of a user inputting the destination information which is the destination of purchase ds is mitigable by having the user interface to which a user can perform a destination input briefly.
- 24] A virtual Mall system according to claim 5 A server and a client are connected to an information network and l server realizes the virtual Mall which consists of two or more virtual online shop by the HTML file. Said client lishes the offer demand of the HTML file of desired virtual online shop through said information network to said /er. The browser screen which uses as the source the HTML file offered from said server is displayed. In the virtual ll system which purchases said goods after choosing the goods for purchase on this browser screen, making fee sulation perform by publishing a fee calculation demand to said server and checking that count result Said client sesses a means to put in and publish Customer ID to Cookie contained in this in the offer demand of said HTML file. I server The customer master which Customer ID is made to correspond and registers the customer information on I client which publishes the offer demand of said HTML file which contains a name, the address, a zip code, and the phone number at least, When the offer demand of said HTML file is received from said client, Said customer master earched based on the customer ID contained in said Cookie, and it is characterized by providing a means to insert the uired customer information in the HTML file to offer, and to offer it to said client. In invention according to claim 5, customer information about the user who purchased goods once by the server side is registered into the customer ster. By setting Customer ID as the request (demand) exchanged between a server and a client, and Cookie contained request (demand) at least among responses (response), and publishing a request (demand) If a customer master is rched with a server side, the income of the customer information can be carried out, and thereby, once a user chases goods, the input of subsequent destination information can be made unnecessary. Moreover, a user's ormation is manageable by the server side.
- - nbodiment of the Invention] Hereafter, the gestalt of operation of this invention is explained to a detail with reference i drawing.
 - 26] Drawing 1 is drawing showing the virtual Mall structure of a system of the 1st operation gestalt concerning this
 - 27] As shown in drawing 1, on information networks, such as the Internet 1, the virtual Mall system of this 1st eration gestalt connects a client machine 2 (a client 2 is called hereafter) and the World-Wide-Web server machine 3 e WWW server 3 is called hereafter), and is constituted.
 - 128] The WWW server 3 and a client 2 are computers which have indicating equipments, such as a monitor connected he body section of a computer which built in CPU, ROM, RAM, a hard disk drive unit, etc., and this body section of omputer, and input units, such as a keyboard connected to the body section of a computer, and a mouse.
 - 129] World-Wide-Web browser software (a WWW browser is called hereafter) is memorized by the hard disk drive t of a client 2. As a WWW browser, it is Internet Explorer (Microsoft Corp. trademark) etc. starting a WWW owser, and inputting or choosing desired Uniform Resource Locator (URL being called hereafter) on the browser
 - een in a client 2, -- Mr. ** on the Internet -- browsing of the **** link can be followed and carried out.)30] The HTML file for realizing a virtual Mall, software (HTTP demon), an operating system (OS), the control tware that operates under the environment of this OS, other various data, etc. are memorized by the hard disk drive it of the WWW server 3. In this WWW server 3, the HTTP demon has always started and prepares for access to each ML file from a client 2. An HTML file is a file which displays the screen of "introduction of a store" for choosing o or more stores which constitute a virtual Mall, the screen which displays the goods or the goods catalog for sale in ch store linked to this screen, the destination input screen linked to this screen, a settlement-of-accounts screen, etc. e control software selects the delivery charge tables 30a and 30b used with reference to the delivery area table 20 and goods master 40, when there is a request from a client 2 side, and it computes the delivery gestalt (delivery type) for ery store, and the tariff which includes a delivery charge for every delivery area.
 -)31] In addition, the delivery area table 20, the delivery charge table 30, the goods master 40, etc. are memorized by rd disk drive unit 3a of the WWW server 3. The delivery charge tables 30 are every store and a table which defines a livery model for every area, and two kinds, the thing of the quantity base and the thing of the amount-of-money base, e set up.
 - 332] As shown in drawing 2, the delivery area table 20 is a table which enabled it to define the case where consist of

- te ID, an area ID, an area name, the order of a display, and a policy, and a delivery charge changes with delivery is, for every store. In case a user chooses a delivery area, the data column of the order of a display is used in order to ne the sequence which displays a delivery area list. It is displayed on order with the small value set, for example as column of this order of a display by the delivery area list. When two or more destinations of the delivery area where it, such as T (sum total) or M (max), enter and correspond have delivery, the data column of a policy is used in order addge whether max is taken for whether the sum total is taken as a delivery charge.
- 33] As shown in <u>drawing 3</u>, delivery charge table 30a of the quantity base is used when a delivery charge calls some certain number some etc. from a certain number per goods, and consists of Store ID, an area ID, a model number, ntity From, quantity To, a delivery charge, and a flag. As a model number, they are No. 10,000-100,000 etc. A flag 0", "1", etc., and even if you are any from quantity From to quantity To in the case of "0", it is the uniform tariff wn by the delivery charge, and, in the case of "1", let the tariff shown by the delivery charge from quantity From to ntity To be a tariff per piece.
- 34] As shown in <u>drawing 4</u>, delivery charge table 30b of the amount-of-money base is used when a delivery charge ased on the purchase amount of money of goods, and consists of Store ID, an area ID, a model number, the amount noney From, the amount of money To, and a delivery charge. A model number number-izes the type of the delivery rge decided with quantity or the amount-of-money base. As a model number, it is for example, No. 100,001 or sequent ones.
- 35] As shown in drawing 5, the goods master 40 defines goods information and is equipped with the data columns, has Store ID, a quotient lot number number, a trade name, and goods price, at least. The data column of a model nber is further added to this goods master 40. The data column of this model number is for specifying any one of h of the above-mentioned delivery charge tables 30a and 30b, if No. 10,000-100,000 is set up as a model number, ivery charge table 30a of the quantity base will be specified, and if No. 100,001 or subsequent ones is set up, delivery rge table 30b of the amount-of-money base will be specified.
- 36] Hereafter, with reference to drawing 6 drawing 8, actuation of the virtual Mall system of this 1st operation talt is explained. In the virtual Mall system of this 1st operation gestalt, if the Internet 1 is accessed by approaches, h as dialup connection, URL of a desired virtual Mall is inputted or chosen on a browser screen and a virtual Mall is essed, starting a WWW browser in the client 2 which a user operates, and displaying a browser screen on the displayen of that monitor, a virtual Mall will be displayed on a browser screen. The goods information on many stores and store of those is displayed on this virtual Mall.
- 37] If the store of a request of a user is chosen from this inside, the screen for goods sale linked to that store will be played.
- Here, if selection actuation of the **, such as [decision], is carried out after inputting a quotient lot number nber etc., in order to purchase desired goods, the destination input screen called a "report" as shown in <u>drawing 6</u> will displayed.
- 139] If a user inputs the store ID of the store which purchases goods following [store:] of this destination input screen, using that store ID as a key, the WWW server 3 will search the delivery area table 20, will acquire an area ID, an a name, the order of a display, and a policy, will use them as a selection box based on the order of a display, and will swer a client 2. The selection box 61 of a receiver's address area is displayed on the destination input screen of a ent 2 by this. Selection of **** 62 gives a list indication of the area name into it.
- 140] Here, if a user chooses a delivery area, inputs each information into each item of [receiver's address address:] and outs each information into each item of [report approach:] out of the area name by which it is indicated by the list, the ormation will be accumulated in the WWW server 3. Then, if the icon (**) 63 of [count of the total amount] is shed, the WWW server 3 will search the goods master 40 by using as a key the quotient lot number number of the ods delivered in the delivery area chosen by the user, and will acquire a model number.
- 141] Then, the WWW server 3 searches the delivery charge tables 30a and 30b by using the area ID and Store ID of a ivery area which were chosen by the acquired model number and the user as a key, and checks in which an plicable record shall exist between delivery charge table 30a of the quantity base, or delivery charge table 30b of the count-of-money base.
- 142] Here, when an applicable record exists in delivery charge table 30a of the quantity base, the WWW server 3 irches delivery charge table 30a of the quantity base by using as a key the goods number which adds the record to an a ID, Store ID, and a model number, and is purchased, and acquires a delivery charge and a flag. For example, in the se of "1" etc., the delivery charge x number serves as [a flag] a delivery charge.
-)43] On the other hand, when an applicable record exists in delivery charge table 30b of the amount-of-money base, livery charge table 30b of the amount-of-money base is searched by using as a key the amount of money of the goods

ch add the record to an area ID, Store ID, and a model number, and are purchased, and a delivery charge is acquired.

- 44] When the policy which repeated the above-mentioned processing and was first acquired when a user purchased goods of two or more classes is "T", a total value serves as a sum total delivery charge, and when a policy is "M", timum serves as a sum total delivery charge.
- 45] Thus, after computing a delivery charge, as shown in drawing 7, detail charts, such as a purchase trade name, an ibute, quantity, a unit price, the total amount of money, a taxation partition, tax rates, and a mailing cost, and ormation, such as the goods sum total, the mailing cost sum total, a consumption tax, and total indicator, are played as "the purchase last check." Here, if icons, such as [payment], are chosen by the user, the WWW server 3 l display the settlement-of-accounts screen which consists of the check section of a bill to address already inputted as input section of an approach which pays for delivery and the browser screen of a client 2 the HTML file of the lement-of-accounts screen linked to this screen at a client 2 as shown in drawing 8. On this settlement-of-accounts en, settlement-of-accounts information is inputted by approaches (off-line settlement of the online settlement of ounts by the card, price exchange, bank transfer, etc., etc.) for a user to pay a request, and if the check screen of a bill iddress is right and a user will choose the icon (**) 81 of a [purchase], one shopping in that store will be completed lit will return to the screen for the original goods sale. Thus, according to the virtual Mall system of this 1st ration gestalt, by an actual department store and an actual mail order, the detailed delivery charge which used intity or the amount of money as the base for every delivery area is set up now, but Also in a virtual Mall system, ivery charge table 30a of the quantity base and delivery charge table 30b of the amount-of-money base are given to WWW server 3. By the delivery approach doubled with a user's hope almost like the actual dealer, a fine delivery rge is computable by using these alternatively. When this has a different delivery charge type at two or more stores virtual Mall, it can support for every store also at what store.
- 46] Next, the virtual Mall system of the 2nd operation gestalt which starts this invention with reference to drawing 9 explained.
- 47] As shown in drawing 9, in addition to client 2 and WWW server 3, the virtual Mall system of this 2nd operation talt connects to the Internet 1 the address retrieval server 5 which has the address master 4 further, and is constituted.
- 148] Data, such as the information of the user who had done some shopping at the store same at least once, for imple, a name, a zip code, the address, and the telephone number, sex, and a birth date, are stored in the address ster 4 of the address retrieval server 5.
- 149] Hereafter, actuation of the virtual Mall system of this 2nd operation gestalt is explained. In this case, if a user uts a part of telephone number or address (henceforth address retrieval information) and pushes a retrieval carbon ton by the destination input screen displayed on the monitor of a client 2, a WWW browser will transmit address rieval information on the Internet 1 to the WWW server 3.
- 150] If the WWW server 3 receives address retrieval information from the Internet 1, the WWW server 3 will transmit address retrieval information to the address retrieval server 5.
- 151] If the address retrieval server 5 receives this address retrieval information, the address retrieval server 5 will luire the name, the zip code, the address, and the telephone number applicable to address retrieval information inceforth address information) from the own address master 4, and will answer the WWW server 3 through the ernet 1.
- 152] If the WWW server 3 receives the answered address information, the WWW server 3 will transmit address ormation to a client 2.
-)53] If a client 2 receives this address information, a WWW browser will divide the received address information into the hitem, and will display it on a destination input screen as confirmed information.
-)54] According to the virtual Mall system of this 2nd operation gestalt, as information which a user inputs, only the dress retrieval information chisel that is a part of telephone number or address is required, and an input can be sharply tigated compared with having had to input a name, a zip code, the address, the telephone number, etc. conventionally.
-)55] Moreover, since the Internet 1 is accessed independently, even if the address retrieval server 4 changes a WWW ver, side [browser], i.e., only [it changes a setup of a communications program], address retrieval is possible for it, d its WWW server 3 is easy also for transplantation to other platforms.
- D56] In addition, although the above-mentioned operation gestalt explained the configuration which connected parately the WWW server 3 and the address retrieval server 5 on the Internet 1, the direct address retrieval server 5 by be connected to the WWW server 3 through the Internet 1 in addition to this, and the address master 4 may be

- ned in the WWW server 3.
- 57] Next, the virtual Mall system of the 3rd operation gestalt concerning this invention is explained.
- 58] In the virtual Mall system of this 3rd operation gestalt, as shown in <u>drawing 10</u>, the customer master 6 is norized by hard disk drive unit 3a of the WWW server 3.
- 59] The request exchanged between the WWW server 3 and a client 2 and Cookie contained in a response can have a second of the than a domain name, pass, and an expiration date only for one. For this reason, can put in all customer brightness, such as a customer's name, the address, a zip code, the telephone number, etc., and it cannot be sent to okie.
- 60] Therefore, ID is given to every customer, and this ID is put into Cookie as a search key of customer information, is sent and received.
- 61] That is, as shown in drawing 11, data called Customer ID, a domain name, pass, and an expiration date are set to okie.
- 62] As shown in drawing 12, as for the customer master 6 of the WWW server 3, customer ID, a name, the address, p code and the telephone number, sex, a birth date, etc. are registered.
- 63] Hereafter, actuation of the virtual Mall system of this 3rd operation gestalt is explained. In the case of the virtual ll system of this 3rd operation gestalt, Cookie is set as the WWW browser started to the client 2 side. In this case, h customer ID is set as Cookie. Once it sets to a WWW browser, even if Cookie drops the power source of a client 2 il it can cut an expiration date, it will be held as setting information on a WWW browser.
- 64] And Cookie is automatically given to a request by the WWW browser which he started when the user is institted (**) and the request a desired store is indicated to be after connecting with the WWW server 3 from the int 2 in order to access the virtual Mall on the Internet 1 (WWW server 3) after the 2nd times, and a request is is is institted (**).
- 65] If the request from a client 2 is received, the WWW server 3 will search the own customer master 6 by using as a the customer ID who acquired Customer ID and acquired from Cookie given to the request from a client 2, will the customer information, and will hold it to own hard disk drive unit 3a.
- And in case the destination input screen called the "report" of <u>drawing 6</u> explained with the 1st operation gestalt lisplayed, each item of the receiver's address address is answered in a response, where customer information is put in .
- 767] Therefore, the screen of a client 2 turns into a screen of only the check in the condition that customer information nt into each item of the receiver's address address, and after it, a user becomes that what is necessary is just to choose icon 63 of calculation of the total amount, after checking each information.
- 168] And it becomes cutting after goods purchase (**).
- 169] Thus, according to the virtual Mall system of this 3rd operation gestalt To be exchanged by the Internet The ide of information (a request, response, etc.), By setting up the WWW browser so that Customer ID may be put into okie contained in a request from a client 2 at least and it may transmit to the WWW server 3 Since a user's ormation is acquired by the W server 3 receiving the request sent and searching the own customer master 6 when a or does some shopping in a virtual Mall, a user does not need to perform a troublesome key input.
- 170] Since a user's information will be displayed on a destination input screen if there is a request when the WWW ver 3 registers into the own customer master 6 the information of the user who accessed the store once and a user es some shopping next time, the destination input by the troublesome user can be made unnecessary.
-)71] Moreover, it is also continuously manageable after making into a customer the user who accessed the store once.
- 172] That is, it becomes possible to realize customer management which conventional on-line system and off-line stem are performing by the virtual Mall system.
-)73] Thereby, by the virtual Mall system, while being able to perform an access control and purchase management of iser, a screen display according to a user can be performed.
- ffect of the Invention] As explained above, according to this invention, the almost same fine delivery charge count as rual shopping can be performed by having had the 2nd delivery charge table which defined the delivery charge of the delivery charge table and goods which defined the delivery charge of goods by the quantity base by the amount-of-oney base.
- O75] Moreover, the input of destination information which a user performs in a virtual Mall system for goods rehase is made into a part of name, zip code, and address, by publishing the retrieval demand containing this, the nount of the information as which a user specifies the destination can be lessened, and a user's burden can be tigated.

76] Furthermore, the customer information about the user who purchased goods once is registered into the customer ster by the server side, and by publishing a request (demand), after setting Customer ID as Cookie contained in the uest (demand) published from a client, if a customer master is searched with a server side, the income of the tomer information can be carried out, and thereby, once a user purchases goods, the input of subsequent destination ormation can be made unnecessary.

anslation done.]
